Regularization: Good for avoiding S Data overfritting multi- Collinearity  $Ls: \qquad \qquad n \qquad \qquad (y_i - (x_i^T o))^2 \qquad \qquad T$  $= (\underline{y} - \underline{x}\underline{\varrho})^{T}(\underline{y} - \underline{x}\underline{\varrho})$ Modified Cost function: Positive > Vegularizer  $S(\theta) = S(0) + \lambda \cdot \gamma(0)$ L3 cost regular zation term  $r(Q) = \int |Q||_{2}^{2} \longrightarrow Ridge regression$   $|Q|, \longrightarrow Lasso regression$   $|Lp-norm of D \rightarrow general form$  Example 1: Ridge regression

$$S(Q) = (\underline{y} - \underline{X}\underline{\theta})(\underline{g} - \underline{X}\underline{\theta}) + \underline{1} ||\underline{\theta}||_{2}$$

Mote that: 
$$1121_2^2 = \sum_i Q_i^2$$
.

 $Q_R = aeg min S(Q)$ 

Solving 
$$(2 \times 3(2)) = 0$$
, yield  $\Rightarrow -x^{T}(2 - x 0) + \lambda \cdot \theta = 0$ 

$$\Rightarrow (x^{T}X + \lambda T_{p}) Q = x^{T} Q$$

$$\Rightarrow \hat{\partial}_{R} = (x^{T}X + \lambda T_{p}) x^{T} Y$$

When 
$$\lambda = 0$$
  $\theta_R = 0$   $\theta_R = (X^T \times)^T X^T Y$ 

$$S(Q) = S(Q) + 2.191,$$
